As I said earlier, the build system looks for the first makefile in a hierarchy and doesn't look in any subdirectories underneath the directory where one was found, hence the need to manually invoke those. Obviously, the code here just goes out and looks for all makefiles underneath. However, some parts of the AOSP either explicitly list subdirectories or conditionally select them based on configuration.

This is not recommended, though, as it's not very portable since it will require you to make this modification to every new AOSP release. As I stated earlier, it's best to keep your custom modifications in device/acme/coyotepad/ in as much as possible.
